License Table

License table is a basis of License Management System used in Guardant Net III/Net II/Net network dongles. Its purpose is to monitor and control licenses in multi-module network software.

When license table is used, Guardant Net network software performs two-level license monitoring:

- The total number of application copies or working stations, running the applications simultaneously, is specified by the actual network license limit
- The number of application copies or working stations, using a specific program module, is specified by this module license limit recorded in the license table.

The license table in Guardant Sign Net/ Time Net/ Net III differs from license table of Guardant Net II / Net dongles:

Dongle model	Hardware locks	Location in dongle memory	Working from within the application (Guardant API)
Guardant Sign Net, Guardant Time Net, Guardant Net III	Read/write locks (protected item)	Between any hardware algorithms/protected items before fields of other types	GrdPI_Activate, GrdPI_Deactivate, GrdPI_Read, GrdPI_Update, GrdLogin, GrdLogout
Guardant Net II, Guardant Net	Write lock	Strictly after hardware algorithms and before fields of other types	GrdRead, GrdLogin, GrdLogout

Thus, the license table in Guardant Sign Net/ Time Net/ Net III **is a special case of a protected item**.
